AIP Bootcamp

Palantir Technologies

I approached this engagement very critically, and I can say that I left exceptionally pleased. It's hard for someone to come in and build a product in one day, especially when we have been working with other entities for months and hadn't seen results.

We worked with Palantir and got the results that we wanted in less than eight hours. We presented to our CEO the very next day."

Elliot Smith → Data Scientist

Palantir Artificial Intelligence Platform (AIP) enables new and existing customers to dramatically accelerate high-value AI use cases. To meet the intense requirements of the moment, we have introduced AIP Bootcamps. In these immersive, hands-on-keyboard sessions, participants can expect to go from zero to use case in just one to five days.

The results speak for themselves. Our partners have been able to solve problems that they have been struggling with for years in a matter of days. They are able to build their own intuition and skillset to be able to independently identify and execute on AIP use cases in subsequent weeks. AIP Bootcamps are also *fun* for all involved, as winning tends to be.

We have a growing backlog of AIP Bootcamps due to the overwhelming demand. In order to make the most of the time we do have together, I wanted to share some early learnings about why our partners are finding these sessions to be so effective.

AIP Bootcamp

Palantir Technologies

"It provided an opportunity for MCBC IT to not only understand the foundational aspects of Gen AI, LLMs and the hype surrounding it, but also to quickly pivot into actually leveraging LLMs on our own data in a secure, protected and interactive manner...

Ramki Krishnamoorthy → Head of Global Enterprise Architecture

**Why It Works**

**No barriers to entry.** AIP comes fully integrated and interoperable; it's enterprise-grade software that's equipped to handle your most sensitive data and primed for your fingertips. AI use cases require a thoughtful blending of stochastic foundation models, calculus-driven enterprise data and tools, and expert feedback loops. AIP Bootcamp participants spend 100% of their time engineering value, not assembling parts.

**Learn to fish, eat a fish.** An AIP Bootcamp isn't about abstract learning or using pre-baked apps. Bootcamps enable participants to tackle their real use cases today while developing the intuition and skills to build independently moving forward. Plan to do both.

**Move from chat to automation.** Molded by initial experiences with GPT-4, many start with the mental model of a chat-style experience. But AIP Bootcamp participants very quickly realize that the non-algorithmic compute potential of the AI revolution reaches far beyond chat. When participants build with prompts derived from real world events translated through the Ontology — not only user input — they become exceptionally creative and ambitious. At AIP Bootcamps, they're developing intelligence that automates processes and provides intelligent primitives for feature-rich business applications.

**Make your AI your own.** Our customers have substantial intellectual property locked in unstructured data repositories and the minds of their talented employees. AIP allows them to immediately incorporate expert-driven feedback loops with

applications that meet the experts where they are as they execute their work. This tight coupling allows them to immediately create unique intellectual property and competitive advantage in their own AI, from their most valuable assets, on day one.

**Define your AI architecture empirically.** Many of the discussions at AIP Bootcamps center around building mental models for AI itself. *How many LLMs should we use? When should we use commercial providers? When can we use open source? When should we fine tune? How far can we get with prompt engineering? How do I effectively integrate AI with other enterprise assets like data, models, and automations? How do we structure effective learning loops to make AI more valuable over time?* Of course, it depends on the use case. The correct technical approach that balances time, cost, efficacy, control, and improvement over time has to be empirical, not theological. And the best way to learn is to follow the shortest possible path to getting initial use cases into production while maintaining technical optionality. We're seeing customers discover and redefine target architectures based on their empirical experiences of getting those initial use cases up and running.

**Any industry, any function.** AIP is driving value from the shop floor to the boardroom. At AIPCon earlier this month, I walked through 50+ examples of how organizations have deployed AIP to drive bottom line impact across virtually every function in dozens of industries in a few short months. The use cases are as compelling as they are diverse. Bootcamps are not just for PhDs or computer scientists.

To bring these concepts to life, I wanted to share a few example AIP use cases that we've seen from our customers, many of which were developed at AIP Bootcamps:

1. **Dynamic Scheduling.** Deploy AIP to optimize complex scheduling of cross-functional activities. AIP is helping optimize flight adjustments, train routing, and healthcare provider schedules.

2. **Underwriting.** Transform commercial underwriting processes with AIP by streamlining human review, seamlessly integrating with underwriting guidelines, and integrating with live views of portfolio risk.

3. **Sales and Marketing.** Leverage AIP for lead triage, context-aware targeted marketing, order management, and next best action workflows.

4. **Procurement.** AIP can identify cost saving opportunities, decompose cost drivers, automate negotiation strategies, and optimize procurement cycles. Palantir itself is using AIP to manage contracts and integrate knowledge seamlessly into operations.

5. **Supply Chain.** AIP can transform supply chain management across diverse industries by continuously synthesizing the state of complex networks and allowing organizations to manage supply chain disruptions by processing inbound signals, identifying potential remediations, and suggesting automated fixes.

6. **Systems Consolidation and Harmonization.** AIP gives IT departments the technical leverage to finally master enterprise system and data entropy. Applications include master data management, material and customer harmonization, and disparate ERP stack integration.

7. **Customer Service.** AIP not only provides AI-driven support for customer service agents, but also allows frontline users to wield the entirety of the enterprise data landscape, including contracts, product usage, and customer information. AIP also seamlessly captures expert feedback to create an experience that improves every day.

8. **Infrastructure Projects and Management.** AIP helps companies delivering major infrastructure projects reduce delays and accelerate delivery by extending continuous integration and delivery (CI/CD) principles into the physical world.

AIP integrates design, engineering, and operating assets into a synthesized dependency model.

9. **Quality and Claims Management.** AIP parses, categorizes, and connects claims and defects from warranty claims to insurance claims to machine defects. The system allows for rapid triage, root cause, and remediation efforts.

10. **Front Line Engineers & Operators.** Put AIP in the hands of front-line engineers and technicians to help streamline workflows, diagnose issues, and optimize repairs out in the field.

11. **Hospital Operations.** AIP can be applied to hospital operations, from predictive nurse staffing to patient bed placement.

Hear from our customers about how AIP is driving impact in their organizations and reach out to your Palantir rep as soon as possible to reserve your AIP Bootcamp slot.

Some questions & observations.

“But AIP Bootcamp participants very quickly realize that the non-algorithmic compute potential of the AI revolution...”— how in the world can any of this be “non-algorithmic”? Algorithms are just instructions, right? So... more
